

COLLECT VALUABLE TRACTOR DATA TO OPTIMIZE UPTIME AND PERFORMANCE

Get insight in:

- Vehicle position and running hours
- Detailed driveline status to control cycle times
- Idling time and fuel consumption
- The optimal maintenance schedule
- The charge cycle and remaining battery capacity (EV)

A dashboard presents all relevant vehicle data and you can create reports to optimize fleet management. Maintenance calls can be generated based on the number of operating hours.

APPS

User friendly apps are developed for fleet managers, technicians and operators/drivers.

INSTALLATION

The Connect hardware unit is installed under the dashboard. It can be supplied as a factory-installed option on new vehicles or easily be fitted under certain conditions to your existing fleet. The Connect unit connects to the vehicle's CAN bus, uses GPS to determine the position and 2G/3G to send the data to the server.
